CK6029**

The CK6029 is a filament type triode of subminiature construction designed for use as a high frequency oscillator up to several hundred megacycles. The design characteristics are optimized for high peak current, high frequency operation at relatively low filament power. The CK6029 is suitable for intermittent service applications such as "push-to-talk" transmitters which do not require long life characteristics. The flexible terminal leads may be soldered or welded directly to the terminals of circuit components without the use of sockets. Standard inline subminiature sockets may be used by cutting the leads to a suitable length.
